The text-critical and exegetical value of the Dead Sea Scrolls

This article will analyse a number of Dead Sea manuscripts and/or fragments in order to determine their linguistic and exegetical value. The article will, firstly, address textual material that is largely in agreement with the Massoretic Text – 1QIsa\(^a\) is a case in point. Secondly, fragments that are seemingly less relevant will be discussed. The less helpful fragments from the Biblical books Proverbs and Job are taken as examples. Finally, highly significant textual differences, such as a fragment from Genesis 1 and one from the complicated books of Jeremiah, will be evaluated.

Introductory Issues

The problem

The discovery at wadi Qumran in 1947 by a shepherd was arguably the most significant as far as biblical texts are concerned.\(^1\) After all, texts such as 1QIsa\(^a\) are more than a millennium older than the Textus Receptus. There are conspicuous correspondences between Massoretic Text (MT) and some Dead Scrolls. At first glance, 1QIsa\(^a\) seems identical to MT Isaiah; both have 66 chapters in the published volumes. However, when scrutinised, prominent differences in addition to correspondences become apparent.

This contribution will take a closer look at a number of Dead Sea manuscripts and/or fragments in order to determine their linguistic and exegetical value. The article will, firstly, address textual material that is largely in agreement with the MT – 1QIsa\(^a\). Secondly, fragments that are on the face of it less relevant will be discussed. The ‘insignificant’ fragments from the Biblical books Proverbs and Job are cases in point. Finally, highly significant textual differences, such as a fragment from Genesis 1 and one from the books of Jeremiah, will be evaluated.

Methodological issues

This contribution will depart from the reality of textual plurality in the pre-common era (Tov 1985). According to this point of departure, the MT is one of the textual witnesses available (Septuagint [LXX], Tgg, Pesh, etc.) but not the most important one. Even so, MT is used as a basis of comparison. The Biblia Hebraica Stuttgartensia (BHS) edition is used for the Hebrew text (MT), DJD 32 for 1QIsa\(^a\) and the Rahlfs pocket edition for LXX.

Textual material largely in agreement with the Massoretic Text (MT)

1QIsa\(^a\)

As is well known, the books of Isaiah and the Psalms are well represented in the Dead Sea Scrolls. Of the first, there are two larger mss, 1QIsa\(^a\) and 1QIsa\(^b\), as well as numerous fragments (Ulrich & Flint 2010). 1QIsa\(^a\) at first sight seems to be identical to MT Isaiah, for one thing, both have 66 chapters in the modern publications.\(^2\) Closer inspection reveals prominent differences. Firstly, the scribes and/or copyists were less meticulous than MT Isaiah’s.\(^3\) The number of later handwritten marginal notes testifies to this (Ulrich & Flint 2010:61). Secondly, there is evidence that the scroll was divided into two parts. In this regard, there is a clear gap of 3 lines at the end of chapter 33, which was used by Giese (1988:61) as main evidence for proposing a bisection (Part 1 = chapters 1–33 and Part 2 = 34–66) in 1QIsa\(^a\). There is additional evidence of a dichotomy in this scroll.

Footnotes:

1. By this statement, I do not intend to belittle the Nag Hammadi discoveries. The recent announcement in the press of a new discovery in the Judean desert is too early to evaluate.
2. It must be remembered that the original publications did not contain chapter and verse indications.
3. The scribal/copyist activity at Qumran is not comparable to the Masoretes’ meticulous work.
This bisection can be observed from some orthographical characteristics of 1Qlsa\(^a\) (Cook 1989, 1992). Data reworked in an electronic Qumran database (Cook 1988) as well as Logos 6, provide the necessary information. The first category is the aleph as mater lectionis used in various positions. The first example is the particle כיא. There are 323 examples in this scroll and 328 occurrences in the Textus Receptus. Defective and plene forms are used simultaneously; however, the plene form (כיא), which does not appear at all in BHS, has been used in the majority of cases, namely 194 times according to Logos. In 129 instances the defective form is used. There is a definite pattern as far as these forms are concerned. In the first part of the scroll (1–33), כיא occurs 123 times and the plene form כיא 34 times. In the second part, כיא appears 4 times and כיא 159\(^b\) times.

In chapters 34 through to 66, there are only 4 cases of the defective form out of 129 occurrences. There is thus a concentration of plene forms in the second part of 1Qlsa\(^a\).

The interrogative particle כיא occurs 63 times in 1Qlsa\(^a\) and in 23 cases the spelling is plene. These are all concentrated in chapters 33–66.

The suffix π/occurs 134 times in 1Qlsa\(^a\) and in 5 cases (30:8; 34:10, 11; 62:4 and 66:10) has the aleph added to the he-κιτ. What is striking, firstly, is that all the plene forms are added after chapter 33. Secondly, not all the suffixes actually had the aleph added. The following pattern prevailed: without: the aleph Isaiah 5:14; 6:13; 8:21; 24:6; 27:4; 30:32, 33; 33:24; 34:17; 37:29; 42:5; 51:3; 56:2; 59:8 and 65:19.

There is thus a pattern of sorts as far as the defective form is concerned, with plene forms being concentrated in the second half of the scroll. On the contrary, 1Qlsa\(^a\) consistently uses defective forms. This phenomenon is probably the result of different scribes.

According to some scholars, there can be no doubt that the dating of textual material is of crucial importance. Hurvitz (2006) phrases it as follows:

Determining the historical age and chronological background of the literary compositions that make up the Hebrew Bible is a demanding undertaking which has lain at the heart of our discipline from its inception. Indeed, dating the biblical texts is indispensible for every aspect of research, textual, linguistic, literary, historical, theological, hence the persistent efforts invested over the years by Old Testament scholarship in dealing with chronological issues. (p. 192)

Not everybody agrees with this point of view.\(^6\) Concerning the value of orthography for introductory issues, scholars also have deviating views. Girdlestone (1892:176) held the opinion that issues of spelling could be useful to determine the age and authorship of sources. Whereas formerly scholars argued that 1Qlsa\(^a\) seems to have been copied by more than one person (Ulrich & Flint 2010:61), there seems to be a consensus that one scribe was responsible for copying the whole book and that later revisers made some changes and added expansions (Ulrich & Flint 2010:63). As stated above, Ulrich and Flint (2010:63) found evidence of scribal activity that can be dated to the Herodian period.

Cross and Freedman (1952:60) also thought that the study of orthography could be valuable for linguistic analyses. The problem with their work concerns the fragmented nature of their subject matter. Andersen and Forbes (1986:63) executed important research in this regard, but concentrated on the Hebrew Bible. This applies to James Barr (1989:2f.) also. He was highly sceptical of endeavours to find solutions to introductory questions via spelling characteristics. He followed a strictly descriptive approach without presenting historical solutions.

There are also more positive views regarding this issue. Martin (1958) took the Dead Sea Scrolls into account. He held the opinion that social factors in fact influenced scribal material. The environment of the scribe and/or copyist therefore also is a determinative factor. The standard research on 1Qlsa\(^a\) and MT remains the book by Kutscher (1974). He also stressed the plurality of textual material at Qumran and suggested that the secluded geographical situation of Qumran should be accounted for by the researcher. Tov (1986) followed a historical approach in this regard. He is of the opinion that there existed two groups of scrolls at Qumran, which can be distinguished on account of their orthography. According to him, one group had a ‘Qumran orthography’ in which plene spelling systems predominated. The second group lacks such forms. It is immediately clear that it is difficult to classify 1Qlsa\(^a\) according to this criterion. Even though plene forms dominate in this scroll, defective ones appear abundantly. On the other hand, 1Qlsa\(^a\) could fit this picture.

Hopefully, it has become clear that the large Isaiah scroll differs in various respects from MT. In my opinion, orthographic characteristics can be useful for addressing introductory issues, as demonstrated by Tov, Ulrich and Flint et al.

‘Insignificant’ textual material
Proverbs

The paucity of textual material of the Dead Sea Scrolls for the books of Proverbs is a problem. Whereas for some books of the Hebrew Bible (e.g. Isaiah and the Psalms) in the Dead Sea Scrolls there are many texts and fragments available, for Proverbs only a few fragments are extant. However, there is a multitude of mss that attest to MT’s.

4QProv\(^a\) and 4QProv\(^b\)

These fragments attest to some Hebrew variants. In Proverbs 1:32 מ ש ב ת there is a variant, מ ש ב ת, testified to by 4QProv\(^a\).
According to De Waard (2008:31), it could be the result of metathesis. In 11:23, there is a variant, מְאֹד הָרֵאשׁ לָעוֹלָם that appears in De Rossi (De Waard 2008:41). In 14:35, MT reads פֶּרֶשׁ, which in De Waard’s (2008:45) opinion seems to be read in 4QProv as פֶּרֶשׁ. According to De Waard (2008:45), פֶּרֶשׁ in fact was the Vorlage for the LXX rendering. Chapter 8 contains a crucial variant, בָּאשׁוֹנָה (artificer) for בָּאשׁוֹנָה in verse 30 (De Waard 2008:14). In 11:7, there is a possible variant, לֹא הָיָה, the reading לֹא הָיָה, which could entail a scribal error (see also 20:21).

4QProv is fragmentary, but according to De Waard (2008:6) in at least five instances supports MT. These are 13:6; 14:32; 15:2, 24 and 28. He also thinks that 3 other cases probably are related to MT, namely 15:22, 26 and 31. In connection with וַיְהִי, in 14:35, there seems to be some relationship between 4QProv, LXX and Pesh.

**Job**

The discovery of fragments of the Hebrew of Job in the Dead Sea Scrolls has unfortunately not thrown light on the issue at stake. There are only a few smaller fragments of Job available. See 4QpaleoJob in P.W. Skehan et al. (1992:155–157), *Qumran Cave 4 IV Palaeo-Hebrew and Greek Biblical Manuscripts*; Cf. also M. Abegg et al. (1999:590–593), *The Dead Sea Scrolls Bible. The Oldest Known Bible Translated for the First Time into English*.

It is a pity that these two books do not have more extant textual material available. The reason why there is a paucity of material of these two books is probably because they were not deemed significant books by the Essene community, at least not as much as Isaiah and the Psalms. In respect of LXX Proverbs, it would have been helpful as far as the hypothetical reconstruction of a different parent text at least not as much as Isaiah and the Psalms. In respect of Gen 1 decided that the final work, man, should be included in the final expression of satisfaction in verse 31, וַיְהִי בָּאשֹׁו, as it was in at least five instances supports MT. These are 13:6; 14:32; 15:2, 24 and 28. He also thinks that 3 other cases probably are related to MT, namely 15:22, 26 and 31. In connection with וַיְהִי, in 14:35, there seems to be some relationship between 4QProv, LXX and Pesh.

**Significant textual material**

**Genesis 4QGen**

The first chapter of Genesis has a complex history of origin and transmission (Schmidt 1964). The difference between MT and LXX testifies to that situation. There are numerous differences in the so-called Hexaemeron (vv. 1–31).

The following general structure can be reconstructed from the two versions (Cook 2001:317):

A. *Wortbericht* (חֹלַק קֳדָשׁ)
B. Ending formula for the *Wortbericht* (וַיְהִי בָּאשֹׁו)
C. *Tatbericht* (חֹלַק הָרֵאשׁ)
D. Namegiving (חֹלַק מְאֹדְדָה)
E. Ending formula for the *Tatbericht* (טֹ֖וב מְאֹד)
F. Ending formula for a day (וַֽיְהִי כֵֽן)

Focusing upon the Hebrew, one becomes aware that there is a discrepancy between the number of days (six) and the number of works (eight) completed during these days, which undermines this ideal structure. Moreover, this structure is not followed in all the days and/or works. The first day of creation does not have a *Tatbericht*. Likewise, the creation of man, should be included in the final expression of satisfaction in verse 31, וַיְהִי בָּאשֹׁו. This could act as an explanation why verses 26–30 have no ending formula.

Turning to the Septuagint, there are prominent differences in comparison with the Hebrew. For one thing, the Septuagint has a much more closely knit structure than MT. Firstly, the equivalent of the Hebrew formula קְדֹם in Genesis 2:9, 19. These chapters are not found in connection with the third and fourth days. However, one can offer explanations for these apparent discrepancies. The non-existence of a *Tatbericht* in connection with the first day is natural because light was seen as the fundamental substance that came about solely by fiat (Westermann 1974:155). It is also possible that the author(s) of Gen 1 decided that the final work, man, should be included in the final expression of satisfaction in verse 31, וַיִּכְלָה. This could act as an explanation why verses 26–30 have no ending formula.

This argument is primarily based upon a translation technical assumption. According to Hiebert (2007:1), ‘The overall assessment of Genesis is that, lexically and syntactically, it is a strict, quantitative representation of its source text’. The Greek translation, in other words, is a relatively faithful rendering of the creation stories, which are related by means of the particle εὖ in Genesis 2:9 and 19. These chapters are also harmonised in that Genesis 1:26 and 2:18 both read the plural ποιήματα, whereas the Hebrew has a singular form in Genesis 2.

These discrepancies were problematic for Jewish exegetes. Ber R iv:6, for example, contains a discussion of this issue: ‘He made – how remarkable! Surely it came into existence at God’s word’. This Rabbinic passage also includes attempts to explain why the ending formula for the *Tatbericht* קְדֹם מְאֹד אֵetheless.
in verse 8 is omitted in MT. This applies also to verse 9 where TG Hagigah 12 (a) offers an explanation for the fact that the Tattericht is missing. Clearly, the discrepancies were difficult for Jewish exegetes to understand, who then formulated some explanations. It should be remembered that for these exegetes, scripture was not discrepant at all.

What is remarkable is that many of the differences between LXX and MT are connected to water. I have argued that the Vorlage is missing. Clearly, the discrepancies were difficult for Jewish exegetes to understand, who then formulated some explanations. It should be remembered that for these exegetes, scripture was not discrepant at all.

In the formulation of a theology of the Septuagint version of Genesis, this could be a prominent topos (Cook 2010).

As far as the differences in the order of chapters are concerned, the most striking example concerns the so-called Oracles against the Nations. Whereas in the MT, these prophecies are found at the end of the book (chs 46–51), in the Septuagint they occur approximately in the middle (chs 26–32). There are also other larger order differences, such as chapter 50 in MT that is chapter 43 in the LXX, the passage that I will discuss.

These textual differences are of determinative importance for an understanding of the Jeremiah collections. Depending on the approach followed by the interpreter, the crucial question in this regard would probably be which of these arrangements should be taken as the original. If one concentrated on the reception of these different texts in diverse contexts, then the original (or earlier) version of the description would probably be of less importance. However, as I demonstrated above, I am of the opinion that, in the process of reconstructing texts, one gathers significant exegetical perspectives (Cook 2009) that can be helpful in arriving at an understanding of the different texts.

Various reasons have been suggested for these remarkable differences. Diverging Hebrew Vorlagen are taken as the reason for these deviations by most scholars (Janzen 1973; Tov 1992a). Rudolph (1968), on the contrary, ascribes to the translator practically all deviations from the MT. Few scholars will today agree with this point of view.

Janzen (1973), who was probably the first scholar to address systematically the issue of Qumran Jeremiah, concluded that the Hebrew Vorlage of the LXX was very conservative and that it had been created not very far removed in time from the Urtext of Jeremiah (Janzen 1973:68). He also deems the LXX to be a better witness to the original text of Jeremiah than the MT, which in his view is expansionistic, and the end result of scribal activity of many manuscript generations (Janzen 1973:68). According to him, the Oracles against the Nations initially circulated separately and were only added to the finished book later (Janzen 1973:115).

As far as the position of a different parent text is concerned, Tov (1985) presents a nuanced position. He distinguishes between literary and textual criticism, arguing that biblical books grew stage by stage throughout a period of several generations (Tov 1992a:316). According to him, even when a book seemed to have attained a completed state, it was often
The problem with this suggestion is that it is speculative. In Egypt (Tov 1992a:316), the earlier editions remained in use in places that were not central from a geographical and sociological point of view, such as the Qumran repository of texts and the various manuscripts from which the Greek translation was prepared in Egypt (Tov 1992a:316).

The following fragment has been reconstructed by Tov (1992b:538):

LXX 50:2–10

For the sake of completeness, I briefly compare the Greek text with 4QJer4. Firstly, these two texts agree largely. However, there are some conspicuous differences. The explication of Baruk as the son of Nariyahu in verse 3 agrees with MT. However, it should rather be seen as an internal harmonisation with verse 6. Instead of γῆς, the Greek reads πρὸς Ημᾶς in verse 3. Still in verse 3 the equivalent of ἔρχομαι is missing, and in verse 10, the equivalent of ἔρχομαι is omitted. In verse 7, the LXX refers to ‘daughters’, whereas 4QJer reads ‘sons’. LXX agrees with MT in this case. The pronoun σοι is used as equivalent for γῆς in verse 9. These minor differences need not be taken as Vorlage differences.

Finally, a few occasional errors in MT are to be noted in either. Firstly, this fragment is a primary evidence of a Hebrew text that corresponds with MT. However, it should rather be seen as an internal harmonisation with verse 6. Instead of γῆς, the Greek reads πρὸς Ημᾶς in verse 3. Still in verse 3 the equivalent of ἔρχομαι is missing, and in verse 10, the equivalent of ἔρχομαι is omitted. In verse 7, the LXX refers to ‘daughters’, whereas 4QJer reads ‘sons’. LXX agrees with MT in this case. The pronoun σοι is used as equivalent for γῆς in verse 9. These minor differences need not be taken as Vorlage differences.
and words calculated and fit with precision. Moreover, Emanu7l Tov is a specialist in this regard. Fourthly, there are conspicuous characteristics in this fragment. The explication of individuals is indicated in red in the text and is a typical trait of MT. Finally, of great significance is the fact that 4QJer and 4Qer both ‘reflect the Hebrew text from which the Septuagint was translated, not just in small details, but also in the recensitional differences in which the Septuagint differs from the MT (shorter text and differences in sequence)’ (Tov 1992b:532).

**Conclusion**

The Dead Sea Scrolls indeed are holding up to their reputation after more than 65 years of research, and we will have to see whether this can be said of the latest discovery in the Judaean desert. This study demonstrated that some scrolls correspond to a large extent with the MT – 1QIsa is an appropriate example. It also showed that fragments should be approached carefully. There are insignificant fragments like those found in the books of Proverbs and Job, at least as far as the theme of this study is concerned. However, fragments from the books of Genesis and Jeremiah proved to be decisive for determining whether there existed deviating Semitic Vorlagen. This in turn opened significant text-critical and exegetical perspectives.
